Grazing native pastures in Tasmania
The forage characteristics and qualities of native grasses

Getting the most out of your pastures is possible if you graze them at the right time. Forage quality is highest when pasture plants are young and actively growing. Different native grass species grow and flower at different times of the year. Some native grasses grow during the warmer months (e.g. kangaroo grass) while others grow during the cooler months (e.g. wallaby grass). Having a mix of species in a pasture will provide the best quality and quantity of feed year round. The native herbs found in diverse, healthy native pastures are also likely to be an important source of nutrition for stock. Many wool producers report that one of the main advantages of native pastures is that protein levels remain relatively constant throughout the year. This increases the chance of the sheep producing a strong fibre, with no break in the staple.

Research by Doug Friend of the Tasmanian Institute for Agricultural Research (TIAR) and studies from elsewhere have shown that not only are native pasture grasses palatable and productive, but at certain times of the year they produce similar levels of protein and energy to improved pasture grasses, even without any fertiliser inputs. Maintaining healthy diverse native pastures through good grazing management will maximise returns from these low input systems.

Native Vegetation and Biodiversity
The Native Vegetation and Biodiversity Sub-program of Land, Water & Wool is exploring ways of managing landscapes so as to maintain enterprise profitability while meeting natural resource management objectives. It is achieving this by working closely with woolgrowers, drawing on the research already undertaken through the Native Vegetation R&D Program managed by Land & Water Australia and undertaking new research on the links between wool production and biodiversity.

The Tasmanian regional project, Biodiversity conservation integrated into sustainable grazing systems, is looking at how woolgrowers currently manage their native vegetation for conservation and production purposes on-farm. This fact sheet aims to describe the forage characteristics and qualities of native grasses and how best to graze them to get the most from them.
Forage qualities of some common native grass species

<table>
<thead>
<tr>
<th>Species</th>
<th>Forage value</th>
<th>Digestibility (%)</th>
<th>Crude protein (%)</th>
<th>Grazing &amp; fertiliser response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wallaby grass (Austrodanthonia spp.)</td>
<td>moderate – high</td>
<td>45 - 82</td>
<td>10 - 25</td>
<td>Tolerates heavy grazing &amp; becomes dominant in these situations. Increases growth with increasing soil fertility (but is less competitive in highly fertile soils).</td>
</tr>
<tr>
<td>Kangaroo grass (Themeda triandra)</td>
<td>moderate – high</td>
<td>54 - 75</td>
<td>5 (winter) – 17 (summer)</td>
<td>Disappears with moderate - heavy stocking rates. Disappears with increasing soil fertility. Responds well to low stocking rates or regular spilling during the growing season.</td>
</tr>
<tr>
<td>Weeping grass or microstipa (Ehrharta stipoides)</td>
<td>high (produces high quality feed)</td>
<td>55 - 80</td>
<td>10 - 27</td>
<td>Tolerates moderate to heavy grazing. Increases growth with increasing soil fertility. Responds well to periodic spelling.</td>
</tr>
<tr>
<td>Common wheat grass (Elymus scaber)</td>
<td>moderate – high</td>
<td>53 - 90</td>
<td>10 - 36</td>
<td>Disappears under heavy grazing. Increases growth with increasing soil fertility. Responds well to periodic spelling.</td>
</tr>
<tr>
<td>Native spear grass (Austrostipa spp.)</td>
<td>moderate - low</td>
<td>&lt;60</td>
<td>3 - 17</td>
<td>Disappears under heavy grazing. Disappears with increasing soil fertility. Responds well to periodic spelling.</td>
</tr>
<tr>
<td>Silver tussock grass (Poa labillardieri)</td>
<td>low (young growth is readily grazed)</td>
<td>42 - 65</td>
<td>4 - 12</td>
<td>Tolerates heavy grazing except under drought conditions. Increases growth with increasing soil fertility. Best forage value from young growth.</td>
</tr>
</tbody>
</table>

Growth characteristics of some common native grass species

<table>
<thead>
<tr>
<th>Species</th>
<th>Flowering time</th>
<th>Time of most active vegetative growth</th>
<th>Drought tolerance</th>
<th>Frost tolerance</th>
<th>Growth characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wallaby grass (Austrodanthonia spp.)</td>
<td>spring - autumn</td>
<td>winter to spring</td>
<td>high</td>
<td>high</td>
<td>Persistent and productive under a range of grazing management regimes. Capable of year-round growth, but most growth occurs during winter and spring.</td>
</tr>
<tr>
<td>Kangaroo grass (Themeda triandra)</td>
<td>summer - autumn</td>
<td>spring to summer</td>
<td>high</td>
<td>low</td>
<td>Actively growing from late winter until early autumn where soil moisture is adequate.</td>
</tr>
<tr>
<td>Weeping grass or microstipa (Ehrharta stipoides)</td>
<td>summer - autumn</td>
<td>winter to spring</td>
<td>high</td>
<td>moderate</td>
<td>Capable of year-round growth. Shade tolerant (common in lightly timbered country). Common on the edge of sheep camps where soil fertility is high.</td>
</tr>
<tr>
<td>Common wheat grass (Elymus scaber)</td>
<td>late winter - summer</td>
<td>winter to spring</td>
<td>moderate</td>
<td>high</td>
<td>Very palatable, can be preferentially grazed and lost from pasture but usually a minor contribution to total pasture production.</td>
</tr>
<tr>
<td>Native spear grass (Austrostipa spp.)</td>
<td>summer - autumn</td>
<td>winter to spring</td>
<td>high</td>
<td>high</td>
<td>Seeds freely and colonises bare ground. Seeds can cause wool contamination &amp; eye damage.</td>
</tr>
<tr>
<td>Silver tussock grass (Poa labillardieri)</td>
<td>spring - summer</td>
<td>winter to spring</td>
<td>high</td>
<td>high</td>
<td>Tall tussocks provide shelter for lambs and roughage for cattle.</td>
</tr>
</tbody>
</table>

Key Points

- Native country is good fine wool country – it is a stable, low maintenance landscape and needs little effort to maintain.
- A mix of species in a pasture will give good flexibility in grazing management – production may be lower but wool staple strength will be good.
- Native grasses are well-adapted to the Tasmanian climate – many producers report that they don’t have to drench or fertilise on native country.
