

2018 BREECH FLYSTRIKE RD&E TECHNICAL UPDATE

Breeding for Breech Strike Resistance –
Genomics Update

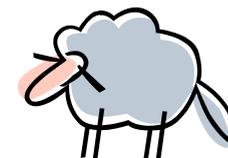

Sonja Dominik – CSIRO Agriculture and Food

17 July 2018

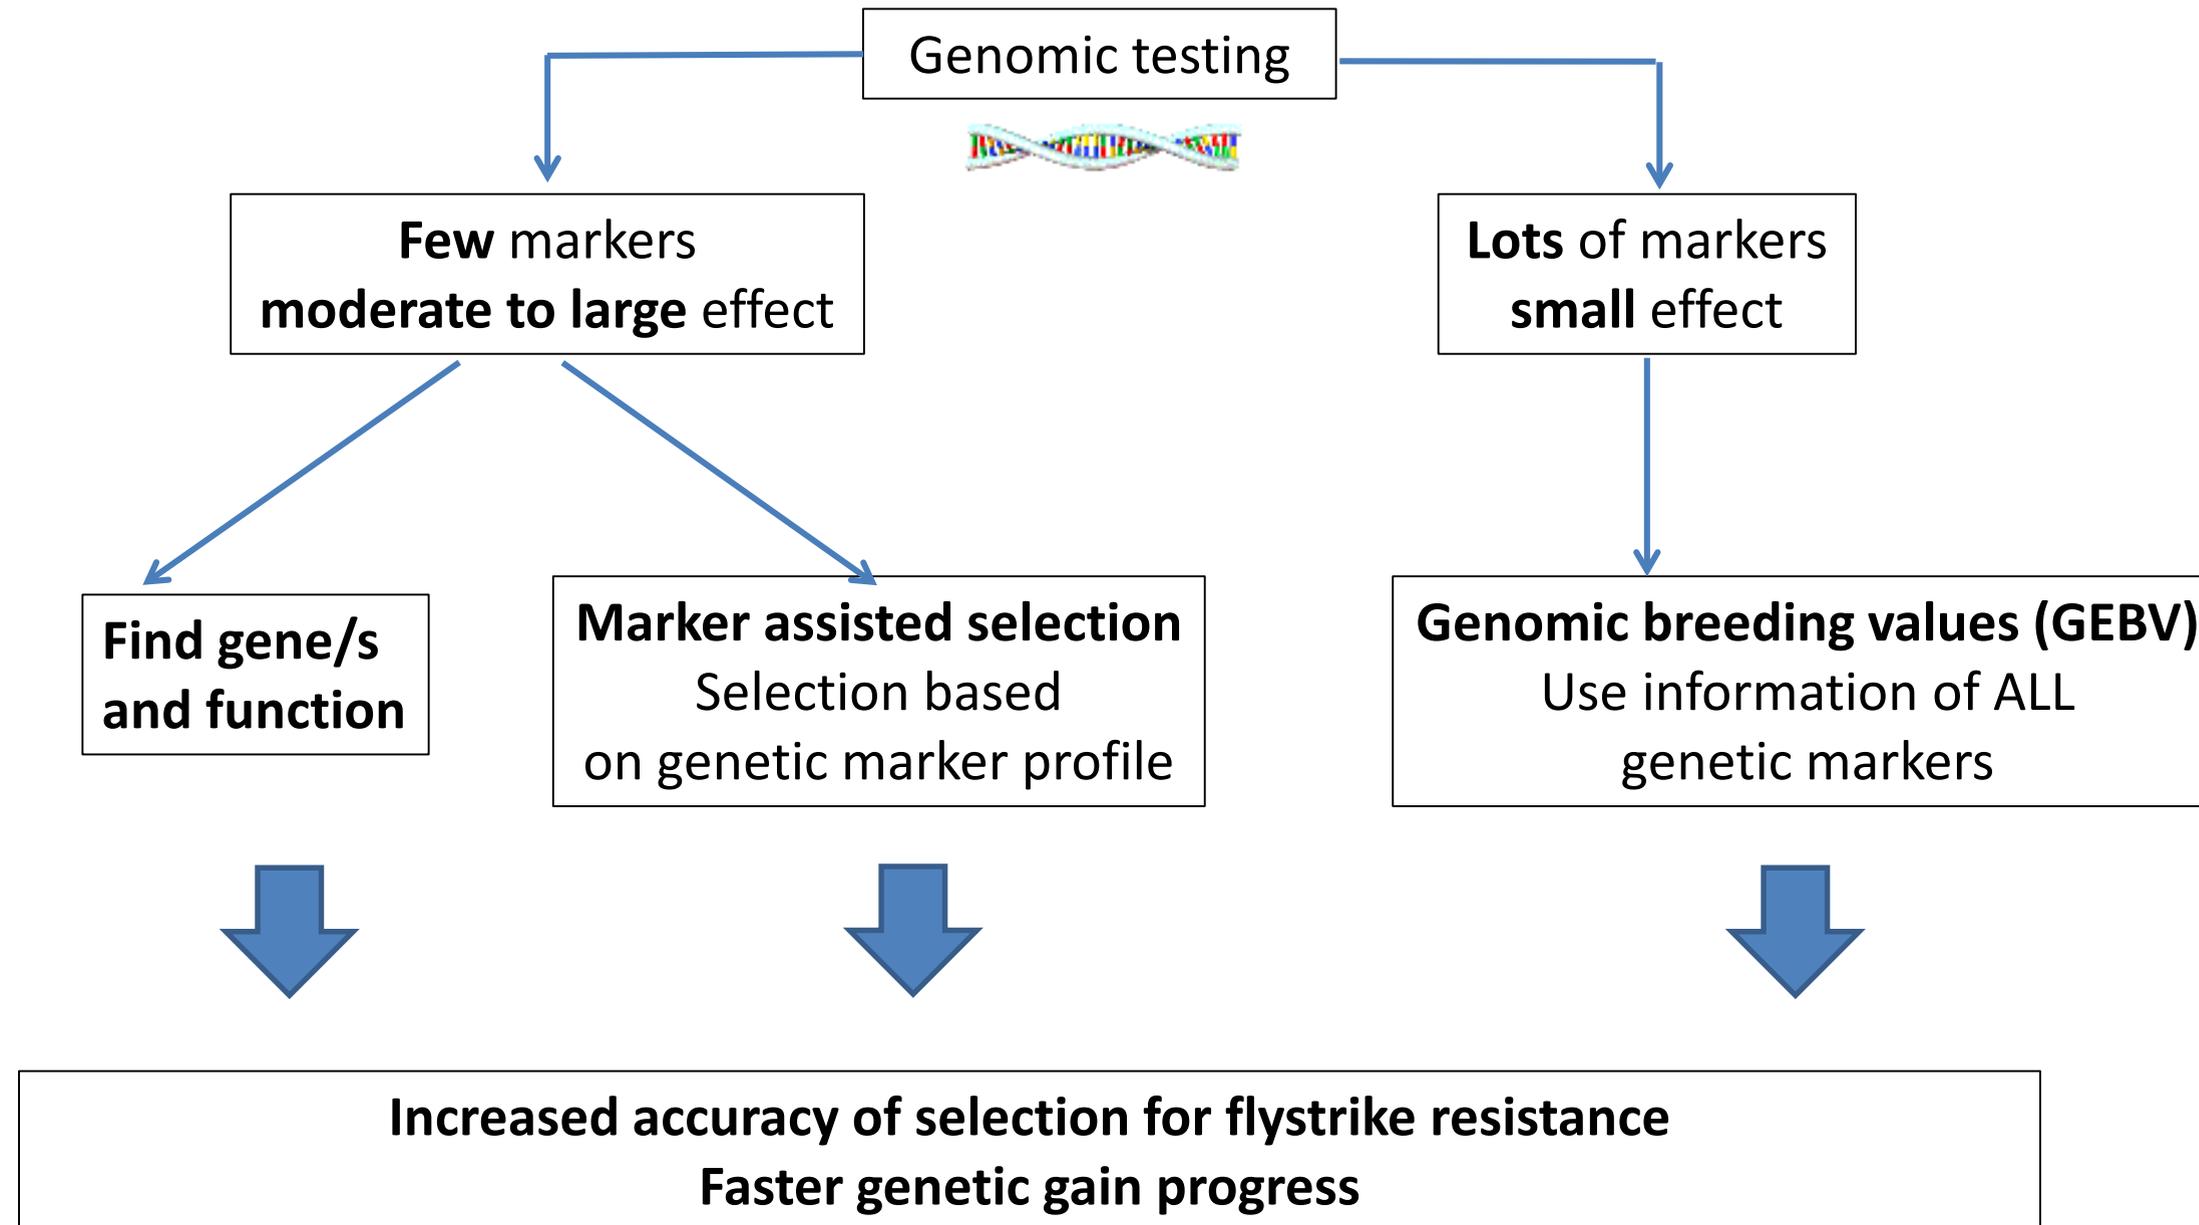

GOOD REASONS FOR A GENOMIC APPROACH

- Flystrike and indicator traits are heritable
- Correlations between flystrike and indicator traits favourable for selection purposes
- Flystrike itself remains difficult to measure, but excellent phenotype resource available in 2 research flocks
- Avenues that can fast track genetic progress can have a large impact on gain

Genomics and Breeding Programs

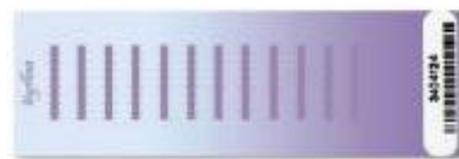

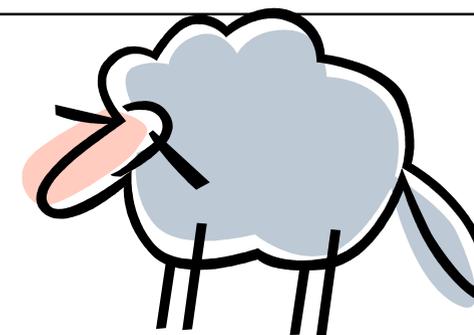

Can we identify regions on the genome associated with breech strike resistance?

Can we estimate genomic breeding values (GEBV) and how accurate are they?

How can we use the information best in breeding programs?

DATA & ANALYSIS

Illumina 700K HD
Genotype data
after quality control
948 samples
528,818 SNPs

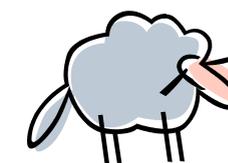

Phenotype data

Breechstrike (STRIKE) (struck, no struck)
Breechcover (BCOV) (low, medium, high)
Wrinkle score (WRK) (low, medium, high)
Dag score (DAG) (low, medium, high)

Genome-wide association study
Estimation and Validation of GEBV

WHAT DID WE FIND IN PHASE 1? (First 5 drops)

- Found a large number of SNP with small effect
- Good indication for the use of Genomic Enhanced Breeding Values
- GEBV's accuracy currently around 11-15%
- Low density panels an option
- A closer look might reveal interesting genes

WE HAVE TAKEN A CLOSER LOOK

Differences in molecular signatures between Resistant vs Susceptible animals

The most promising region harbours a single gene with key role in the recognition of pathogens and initiation of immune response

RES and SUS are divergent for the SNP in that region, but needed more data

NEXT- PHASE 2 last 5 drops, final report due late 2018

50K genotypes of another 576 animals from NSW and WA Breech Strike Flocks

- Clearer phenotypic differentiation in the later 5 drops compared to first 5
- Another 576 animals in breech strike reference population, will increase accuracies
- Option to develop low density panels for cost-effect capture of variation
- Potential to follow up on interesting genes
