

Bookham wether trial results, year 2 – 2020

- Thanks to the participants because without you there is no trial, to the sponsor Butt livestock for lunch and Craig Lawson from Landmark for the wool valuations.
 - Congratulations to Dave Weir for the excellent condition of the wethers in a difficult year.
 - The results this year have a high degree of robustness due to the fact that any age differences on entry have now disappeared. This is obvious from the tight fibre diameter range across the teams.
 - This trial is run for 4 shearings because we want to use the information to reflect what is happening to breeding flocks of the same bloodlines. Except for the reproduction data, wool production from wethers is highly correlated to ewe's wool production. In line with the wool to meat ratio from ewes the value of the carcass will be included at shearing 4.
 - The body weights in the tables is an off shears weight.
 - The wool yield in the shearing table is a yield of the fleece wool calculated from the washing yield of the mid side sample. The average yield takes account of the lower yields of the oddments.
 - The tables have some rounding errors which explains some slight differences between teams but the calculations are done on the correct numbers, eg FD is the same but the wool price is different
 - A rule for all Bookham trials is that teams are allowed to lose 2 wethers and it does not affect the results because the total is divided by 9 or 8 wethers but after that the average value per head is impacted by being divided by 8 regardless of the number in the team. This rule has impacted 1 team this year.
 - The teams that originated off a stud are marked in the summary tables in blue.
 - The following tables are provided to allow you to assess the performance of the teams.
1. The full team shearing details, – due to display issues this will be sent as a separate file
 2. The team summary sorted on average value per head, - gives a measure of the wool genetics of the sheep
 3. The team summary sorted on total wool value of the team, - adds the wool genetic value to the robustness of the sheep.
 4. The team summary sorted on average value per dse, - expresses the wool genetics on a common feed basis. There is no data to say bigger sheep are more efficient re using pasture. Bigger sheep eat more. The impact of bigger sheep on meat value and reproductive performance will be looked at after the final shearing.
 5. Comparison of wool prices for the 2 years, - shows how prices will have varied the \$/hd return between years. This year has had lower price differences between microns.
- It is my view that the true assessment of the performance of bloodlines should be based on these 3 factors as it is the combination of these factors that drives your profitability of the merino enterprise. Different merino enterprises i.e. aims to sell all wethers off into the lamb market vs keeping wethers for 2 shearings will mean different traits are required in the respective bloodlines.

- The dse value will become more robust over the life of the trial.
- At this stage of the trial you can use the 3 data sets to look at the relative wool production merit of the teams. Teams that perform well on all the measures have robust performance.
- 15 years ago, the top team cut twice as much as the bottom team on a \$/hd basis, now the differences are small. Small changes to the wool market would mix up the team's position. I think you are looking for difference of the order of \$5/hd on the average value to say there is a difference between teams.

Graph 1.

- The prices are the average of weekly values from Feb to Feb for each of the years. The current premium and discounts are then applied for any faults. The wools were sound with only 2 or 3 W1 fleeces and no discounts for colour. The yields were lower due to the increased dust and seed VM.

Compiled using data collected at the shearing and from mid side samples taken 3 weeks before.

Phil Graham
